

WATER CRISIS

COUNTRIES LIKE AFGHANISTAN, CAMBODIA, HAITI, PAKISTAN AND SYRIA ETC.

Afghans are confronting water deficiencies because of the drought that has attacked the nation last year.

In numerous spots, including the capital Kabul, residents need to convey holders to fill at water points a few times each day.

Water should be easily accessed to and available 24/7 but that's not the case for these people, instead they have to walk long hours in heat and carry bottles to fill with water.

Canada's fresh drinking water

We are extremely lucky to have this clean water in fact Canada has strict rules with respect to our water. With 9% of the world's freshwater assets, Canadian cities appreciate nonstop access to high- quality and great drinking water. I bet you don't even have to worry about when you will be able to drink water or even if your water is contaminated but many kids in other countries do.

Afghanistan's dirty water

Kids get abandoned from their parents because they die or just can't take care of them. Many kids who don't have parents walk the streets and kids from the age of three would be found dead because they would wander into areas with water and drown. Nobody cares or even notices that these kids are dying. This needs to end.

Looking back at the other slide and compare our water you could tell how clean and fresh it looks like.. This is the water that the people in Afghanistan have to drink. If this isn't bad, try walking 3-4 hours to even access this dirty water. Over 87% of the water is contaminated which is the

charge*

Vlad and I (Jeffrine) noticed that we need to help these children out and target many kids around the world to try and end dehydration and help with malnourishment; so we invented they "Solis Filtrum".

The Solis Filtrum in Latin words means sun/ energy and filter

The solis Filtrum is two panels designed to filter and mineralize dirty water and transfer it to clean water. Many kids lack vitamins and minerals so we would be doing 2 in 1, filtering the water and adding minerals to help strengthen these kids.

We will also have a second filter to filter out water and spray nutrients that will enrich the soil and water crops through a prayer every 5-6 hours which will be provided by our company and this will help with the growth of plants.

We want to bring food and water to these people instead of have them come for the water. This will help keep them less exhausted and will allow them to access it quickly.

Our inventions is environmentally friendly and will really help families and kids in need. We are trying to prevent drowning, malnourishment and dehydration for all these people around the world. Help be the first one to make a change today.
